

Customer Journey Map

Date	28 September 2026
Team ID	
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Customer Journey Map

Map the customer's experience step-by-step, capturing actions, touchpoints, thoughts, feelings, process ownership, and opportunities for improvement.

Phase of Journey	Stage 1 – Identify Problem	Stage 2 – Implement Solution	Stage 3 – Verify & Use
Actions	- Identify unauthorized record access problem. - Check existing access permissions. - Understand branch-based access requirements.	- Create the required table and records. - Create users and assign roles. - Configure Script-Controlled ACL using Branch value.	- Login as EEE User. - Verify access to EEE records. - Check that other branch records are restricted.
Touchpoints	- ServiceNow instance - User records - Existing ACL settings	- ACL configuration - User and Role settings - Branch field and script	- ServiceNow table - Record list - Read/Delete access verification
Customer Thoughts	"How can unauthorized access be prevented?" "Which users should access the records?" "Can access be controlled based on Branch?"	"Will the ACL script correctly check the Branch?" "Are the required roles assigned?" "Will administrators retain full access?"	"Can I view only the allowed records?" "Are restricted records protected?" "Does the ACL work as expected?"
Customer Feeling	- Concerned about data security. - Confused about access control. - Need for a clear solution.	- Hopeful about the solution. - Focused during configuration. - Confident after successful testing.	- Satisfied with controlled access. - Secure about record visibility. - Confident in the implemented solution.
Process Ownership	- Project team identifies the access problem. - Admin analyzes existing permissions.	- Project team creates the ACL. - ServiceNow administrator configures users, roles and scripts.	- Project team performs testing. - Administrator verifies access and security.
Opportunities	- Improve record security. - Identify branch-based access requirements. - Reduce unauthorized access.	- Automate access control using scripts. - Apply role and field-based conditions. - Give administrators full access.	- Test with multiple branch records. - Improve security verification. - Extend the solution to other tables and fields.

Project: Script-Controlled ACL – Restrict Record Access Based on Field Value
