

SCRIPT-CONTROLLED ACL

Restrict Record Access Based on Field Value

1. Objective

To create a Scripted Access Control List (ACL) in ServiceNow that restricts record access according to the value stored in a selected field. The ACL allows access only when the record satisfies the required field condition.

2. Requirement

Example requirement: Users should be able to read a record only when the record's Department field matches the user's department. If the values do not match, access to the record is denied.

3. ACL Configuration

Field	Configuration
Type	Record ACL
Operation	Read
Table	Required target table, e.g. Incident [incident]
Name	Table.* or the required table field
Advanced	Enabled
Condition	Optional; use when a simple condition is sufficient
Script	Compare the record field value with the logged-in user's value

4. Script

```
(function () {  
  
    // Allow admin users full access  
  
    if (gs.hasRole('admin')) {  
  
        return true;  
  
    }  
  
    // Allow only EEE branch users to see EEE records  
  
    if (gs.hasRole('bb1')){  
  
        return true;  
  
    }  
  
    // Deny access for all others  
  
    return false;  
  
})();
```

5. Working Flow

ServiceNow – Script-Controlled ACL | Restrict Record Access Based on Field Value

1. User requests access to a record
2. ServiceNow evaluates the applicable ACL
3. ACL reads the selected field value from the record
4. ACL gets the corresponding value for the logged-in user
5. Values are compared
6. Match → Access Allowed
7. No Match → Access Denied

6. Expected Result

- Users can access only records that satisfy the field-value rule.
- Records with a different field value are restricted.
- The access rule is enforced at the ACL level.
- The same approach can be adapted to fields such as Department, Company, Assignment Group, Location, or other reference/string fields.

7. Conclusion

A Scripted ACL provides record-level access control based on business logic. By comparing a record field with a value associated with the logged-in user, ServiceNow can allow or deny access dynamically.
