

SCRIPT-CONTROLLED ACL

Restrict Record Access Based on Field Value

Date	29 September 2026
Team ID	SWTID-2026-2867
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Document Type	ServiceNow Technical Documentation
Functional Requirement	Script-Controlled ACL
Purpose	Restrict record access based on a field value
Platform	ServiceNow

Objective

Create a Scripted Access Control List (ACL) in ServiceNow that allows or denies record access depending on the value stored in a selected field.

Product Backlog, Sprint Schedule and Estimation

Sprint	Functional Requirement	User Story Number	User Story / Task	Story Points	Priority	Team Members	Sprint Start Date	Sprint End Date
Sprint-1	ACL Creation	USN-1	As an administrator, I can create a record ACL to control access to records.	2	High			
Sprint-1	Field-Based Access	USN-2	As an administrator, I can restrict access based on a field value.	2	High			
Sprint-1	ACL Script	USN-3	As an administrator, I can use a script to allow access only when the field value matches the rule.	3	High			
Sprint-2	Testing	USN-4	As an administrator, I can test allowed and denied records for different field values.	2	Medium			

ACL Configuration

Property	Configuration
Type	Record ACL
Operation	Read
Table	Target ServiceNow table
Advanced	Checked
Access Rule	Allow access when u_access_level = Public

Script

```
answer = current.u_access_level == 'Public';
```

The script checks the `u_access_level` field. If its value is `Public`, the ACL returns `true` and the record can be read. For other values, it returns `false` and access is denied.

Working Flow

Step	Process
1	User requests access to a record.
2	ServiceNow checks the applicable ACL.
3	The ACL script reads the selected field value.
4	If the value is <code>Public</code> , access is allowed.
5	If the value is not <code>Public</code> , access is denied.

Result

The Script-Controlled ACL restricts record access according to the configured field value, providing record-level security.
