

PROJECT DOCUMENTATION
Script-Controlled ACL – Restrict Record Access Based on Field Value

Field	Details
Date	29 September 2026
Team ID	SWTID-2026-2867
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Project Title

Script-Controlled ACL to Restrict Record Access Based on Field Value

2. Objective

The objective is to control access to ServiceNow records using an Access Control List (ACL) with a script. The ACL checks a field value in the record and allows or denies access based on the configured condition and user role.

3. Problem Statement

Some ServiceNow records may contain restricted information. Allowing every user to access such records can create a security risk. A scripted ACL can dynamically restrict record access based on the value stored in a specific field.

4. Proposed Solution

Create a Read ACL on the required table. The ACL script checks the record's Access Level field. Public records are accessible to authorized users, while Restricted records are accessible only to users having the required role.

5. ACL Configuration

Property	Configuration
Table	Incident [incident]
Operation	Read
ACL Type	Record ACL
Condition	Script controlled
Field Checked	u_access_level
Restricted Role	u_restricted_access

6. Script

```
(function () {  
  
    // Allow admin users full access  
  
    if (gs.hasRole('admin')) {  
  
        return true;  
  
    }  
  
    // Allow only EEE branch users to see EEE records  
  
    if (gs.hasRole('bb1')){  
  
        return true;  
  
    }  
  
    // Deny access for all others  
  
    return false;  
  
})();
```

How the workflow works

1. User tries to access a record

- ServiceNow evaluates this script as part of the relevant ACL.

2. Check for admin role

3. if (gs.hasRole('admin')) {

4. return true;

5. }

- gs.hasRole('admin') checks whether the current logged-in user has the admin role.
- If yes → true is returned.
- Access is **granted immediately**.
- The remaining code is not executed.

6. If the user isn't an admin, check bb1

7. if (gs.hasRole('bb1')) {

8. return true;

9. }

- If the user has the bb1 role → true.

- Access is **granted**.

10. **Everyone else**

11. return false;

- Users without either admin or bb1 get false.
- Access is **denied**.

07. Expected Result

The ACL successfully restricts record access according to the value of the Access Level field. Restricted records can only be viewed by users who satisfy the required role condition.

08. Conclusion

The Script-Controlled ACL provides dynamic record-level security in ServiceNow. It prevents unauthorized users from viewing restricted records and ensures that access is granted according to defined business rules.

09. Technologies Used

- ServiceNow
- Access Control List (ACL)
- JavaScript / ServiceNow scripting
- User roles and record-level security
