

Scalability & Future Plan

Date	29 September 2026
Team ID	SWTID-2026-2867
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	1 Mark

Scalability & Future Plan:

This document explains how the Script-Controlled ACL solution can be scaled to support more users, larger data volumes, improved performance, and stronger security. The solution dynamically restricts record access based on field values.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address
1	Access rules may depend on fixed field conditions.	Incorrect configuration may allow or deny access unexpectedly.	High
2	Complex ACL scripts can be difficult to maintain.	Maintenance and troubleshooting become harder.	Medium
3	Too many database queries inside ACL scripts can affect performance.	Record access may become slower.	Medium

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Supports normal user access.	Optimize ACL logic to support more concurrent users.
2	Data Storage	Records are stored in ServiceNow tables.	Use proper indexing and data management practices.
3	Performance	ACL script runs during record access.	Minimize unnecessary queries and optimize script conditions.
4	Security	Access is restricted using field values.	Combine field-based checks with role-based access where required.

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Implement field-based Scripted ACL	Current	Restricts unauthorized record access.
Phase 2	Add role-based access validation	1–2 Months	Improves access control and security.
Phase 3	Optimize ACL scripts for performance	2–3 Months	Reduces unnecessary processing and improves response time.
Phase 4	Add auditing and access monitoring	3–6 Months	Improves security tracking and accountability.

Key Objective: The Script-Controlled ACL dynamically restricts record access based on field values, ensuring that users can access only the records they are authorized to view.
