

Project Development Phase

Date	28 September 2026
Team ID	SWTID-2026-2867
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Introduction

The development phase is the implementation stage of the project. In this phase, the planned design and requirements are implemented in the ServiceNow platform.

2. Development Activities

Step 1: Create the User

A test user named **EEE User** is created in ServiceNow.

Step 2: Create Roles

The required roles are created:

- **bb1**
- **bb2**
- **bb3**
- **bb4**

The roles are assigned to the EEE User as required.

Step 3: Create the Table

A custom table named **Institution Details** is created.

The table contains fields such as:

- Student Name
- Roll Number
- Faculty
- Branch
- Email
- Phone Number
- Description

Step 4: Configure the Branch Field

The **Branch** field is configured with the following values:

- ECE
- EEE
- CSE

Step 5: Create ACLs

ACLs are created for the **Institution Details** table to control:

- Read
- Create
- Write
- Delete

Step 6: Add the Script

A script is added to the **Read ACL** to check the Branch field.

The EEE User is allowed to view records where the Branch value is **EEE**.

Step 7: Test the Configuration

The configuration is tested by impersonating the **EEE User**.

The Read, Create, Write, and Delete permissions are checked to make sure the ACLs work as expected.

3. Expected Result

After development, the system should control record access based on the user's roles and the Branch field value.

The EEE User should be able to access the records permitted by the configured ACLs.

4. Conclusion

The development phase implements the project requirements and design in ServiceNow. The ACLs and scripts provide controlled access to the **Institution Details** records.
