

Requirement Analysis Phase

Date	28 September 2026
Team ID	SWTID-2026-2867
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Introduction

The main purpose of this project is to control access to records in ServiceNow using **Access Control Lists (ACLs)** and scripts.

The system should allow users to access records based on their assigned roles and the value of a specific field.

2. Problem Statement

In ServiceNow, different users may need access to different records. Giving users access to all records can cause security problems.

To solve this, the project restricts record access based on:

- User roles
- Branch field value
- Required ACL permissions

3. Requirements

Functional Requirements

1. Create a test user named **EEE User**.
2. Create and assign the required roles: **bb1, bb2, bb3, and bb4**.
3. Create an **Institution Details** table.
4. Add fields such as:
 - Student Name
 - Roll Number
 - Faculty
 - Branch
 - Email
 - Phone Number
 - Description

5. The Branch field should contain **ECE, EEE, and CSE**.
6. Create ACLs for:
 - Read
 - Create
 - Write
 - Delete
7. Use a script in the Read ACL to allow the user to view only **EEE** records.
8. Test the ACLs by impersonating the test user.

4. Non-Functional Requirements

- The system should provide secure record access.
- ACLs should work correctly based on user roles.
- Unauthorized users should not be able to access restricted records.
- The configuration should be simple and easy to maintain.

5. Expected Outcome

After implementing the requirements, the **EEE User** should only be able to access records allowed by the configured roles and field conditions.

The project demonstrates how **ServiceNow ACLs and scripts** can be used to control record-level access.

6. Conclusion

The requirement analysis identifies the security and access-control needs of the project. These requirements will be used in the next phase to design and implement the ACL configuration in ServiceNow.
